

SPECIAL POINTS OF INTEREST:

- Get the most from your investment through training
- Learn new techniques that will increase efficiency
- Have confidence to present larger cases and increase case acceptance

Introduction to CEREC Dentistry

During the first years of the CEREC Dentistry Programme, 157 dentists undertook one module or another!

The feedback from these courses has been phenomenal. Overwhelmingly delegates enjoyed the relaxed atmosphere, the low numbers and hands on approach to training. The call is for "more courses".

Introduction to CEREC Dentistry.

Of the 117 people who undertook the Introductory Training Course, 83% were associates or repeating the course for a second time. The key to really maximising your investment in CEREC is to get the machine working. "If I can hear the milling unit working I am happy," com-

mented one practice owner. "My associates were slow to come around but after we took some proper training at the DTI they are now fighting

Happy delegates gather in the Courtyard Clinic during the Advanced CEREC Dentistry course.

for the machine."

'Anterior Aesthetics & Multiple Units' it's a bit of a mouthful!

A mouth full of CEREC's!

"The money is in the back of

the mouth," reminds Dr Simon Smyth. Multiple units and quadrant dentistry increases the profitability of delivering care. Patients benefit from reduced appointment time and less anaesthetic.

The 2-day course is designed to provide delegates with the skills needed to use a variety of design techniques depending on the clinical situation in the mouth. Much of the course is hands-on scanning, designing and milling CEREC's on the CEREC acquisition and milling machines in the DTI.

"My objectives is to teach techniques that can be used on Monday morning to pay-back the cost of the course."

Having mastered the techniques during the course, the level on confident increases and so does case acceptance.

Advanced CEREC Dentistry

Delivering stunning anterior restorations requires knowledge, skills and judgment. The course module developed by Dr Smyth delivers all three. Delegates learn how to use CEREC to design and mill anterior crowns and veneers. How to add cut backs and fuse on translucent incisal edges. How to easily stain and glaze the milled ceramic to produce characteri-

sation that make amazingly life-like restorations.

The module starts with a refresher of smile design principles, record taking and treatment planning. You will learn how to use wax-ups to trial smiles and then scan them in. You will learn how and when to use different design techniques to deliver better results and increase efficiency.
